Agenda

1. Problem Statement
2. Exhaustive Search Algorithm
3. Sequential Program Demo

Boolean Satisfiability

Boolean satisfiability is an *NP*-complete decision problem defined as:

$$SAT : \phi \rightarrow \{YES, NO\}$$

Input: Boolean formula ϕ on n variables.

Output: *YES* if there exists a variable truth assignment to the variables in ϕ that will cause it to evaluate to true, *NO* otherwise.

$$\phi \text{ is satisfiable} \Leftrightarrow SAT(\phi) = YES$$

3-*SAT* $\in$ *NP*

- A special case of *SAT* that fixes the format of ϕ.
- Each input formula is in 3-*CNF* form:
  - The conjunction (Boolean AND) of arbitrarily many clauses, where each clause is the disjunction (Boolean OR) of exactly three literals (a literal is a Boolean variable or its negation).

$$(x_1 \vee x_2 \vee \neg x_3) \wedge (x_1 \vee x_2 \vee x_3) \wedge (x_1 \vee x_2 \vee x_3)$$

- *SAT* reduces to 3-*SAT*, so 3-*SAT* $\in$ *NP*.

Exhaustive Search for 3-*SAT*

Input: 3-*CNF* formula ϕ_n on n variables
Output: YES or NO

1: $C \leftarrow 2^n \times n$ Boolean matrix (all possible variable configurations)
2: **for** $r = 0 \rightarrow 2^n - 1$ **do**
3: **for** $i = 0 \rightarrow n - 1$ **do**
4: Assign $C[r][i]$ to each literal of variable i in ϕ_n
5: **end for**
6: **if** $evaluate(\phi_n) = TRUE$ **then**
7: **return** *YES*
8: **end if**
9: **end for**
10: **return** *NO*

Algorithm 1: Exhaustive search for 3-*SAT*.

Exhaustive Search for 3-*SAT* (continued)
