2 Exhaustive Search Algorithm

3 Sequential Program Demo

Boolean Satisfiability

Boolean satisfiability is an *NP*-complete decision problem defined as:

$$SAT : \phi \rightarrow \{YES, NO\}$$

Input: Boolean formula ϕ on *n* variables.

Output: *YES* if there exists a variable truth assignment to the variables in ϕ that will cause it to evaluate to true, *NO* otherwise.

$$\phi \text{ is satisfiable} \Leftrightarrow SAT(\phi) = YES$$

3-*SAT* $\in$ *NP*

- A special case of *SAT* that fixes the format of ϕ.
- Each input formula is in 3-*CNF* form:
    - The conjunction (Boolean AND) of arbitrarily many clauses, where each clause is the disjunction (Boolean OR) of exactly three literals (a literal is a Boolean variable or its negation).

$$(x_1 \vee x_2 \vee \neg x_3) \wedge (x_1 \vee x_2 \vee x_3) \wedge (x_1 \vee x_2 \vee x_3)$$

- *SAT* reduces to 3-*SAT*, so 3-*SAT* $\in$ *NP*.

Exhaustive Search for 3-*SAT*

Input: 3-*CNF* formula ϕ_n on n variables, **Output:** YES or NO

1: $C \leftarrow 0^n$ (vector of n 0, the initial configuration)
2: **for** $r = 0 \rightarrow 2^n - 1$ **do**
3:    $SAT \leftarrow TRUE$
4:    **for all** *clause* $\in \phi_n$ **do**
5:      **if** *evaluate*(*clause*, C) = *FALSE* **then**
6:        $SAT \leftarrow FALSE$
7:      **end if**
8:    **end for**
9:    **if** $SAT = TRUE$ **then return** *YES*
10:   $C \leftarrow nextConfig(C)$
11: **end for**
12: **return** *NO*

                          Algorithm 1: Exhaustive search for 3-*SAT*.
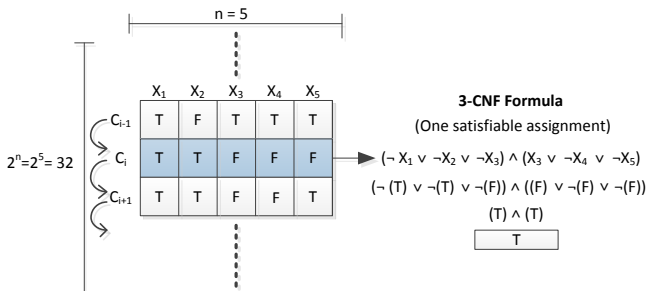

Exhaustive Search for 3-*SAT* - A *Very Satisfiable* Example!

Input: $\phi_5 = (\neg X_1 \vee \neg X_2 \vee \neg X_3) \wedge (X_3 \vee \neg X_4 \vee \neg X_5)$

Output: Yes

Note: no early termination once a satisfiable solution is found

The Sequential Solver

Demo time!

$$\phi_5 = (\neg X_1 \vee \neg X_2 \vee \neg X_3) \wedge (X_3 \vee \neg X_4 \vee \neg X_5)$$
